

Deep Learning - Part 1

Aymeric DIEULEVEUT

DS4M - April 2025

Outline

1 Convolutional Neural Networks

2 Applications

- Image classification
- Pose, action detection
- Object detection and segmentation
- Scene labeling - Semantic segmentation
- Object tracking - videos
- Limits and challenges

We consider an **image classification task**: we want to recognize which object is on an image.

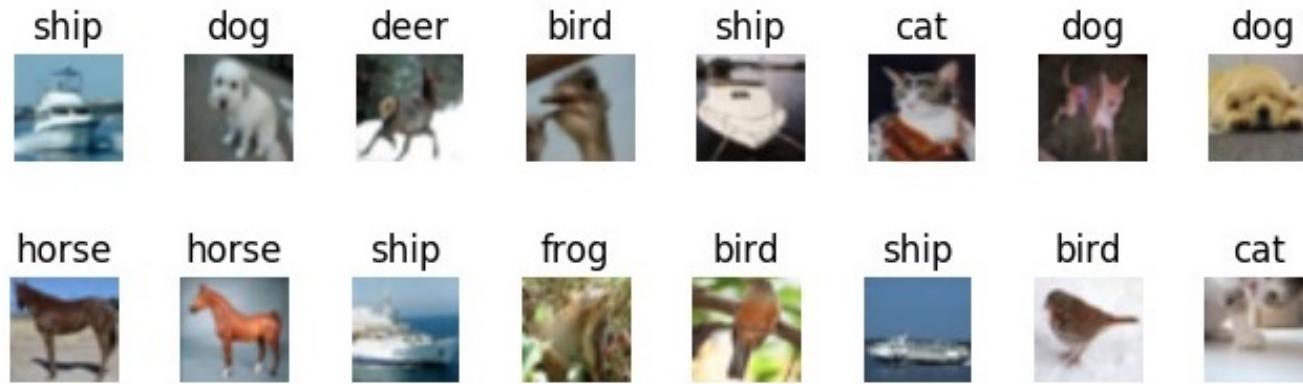

Figure: CIFAR dataset

The input is an image: about 10^3 to 10^7 pixels: these are our inputs.

Problems: The multi-layer perceptron:

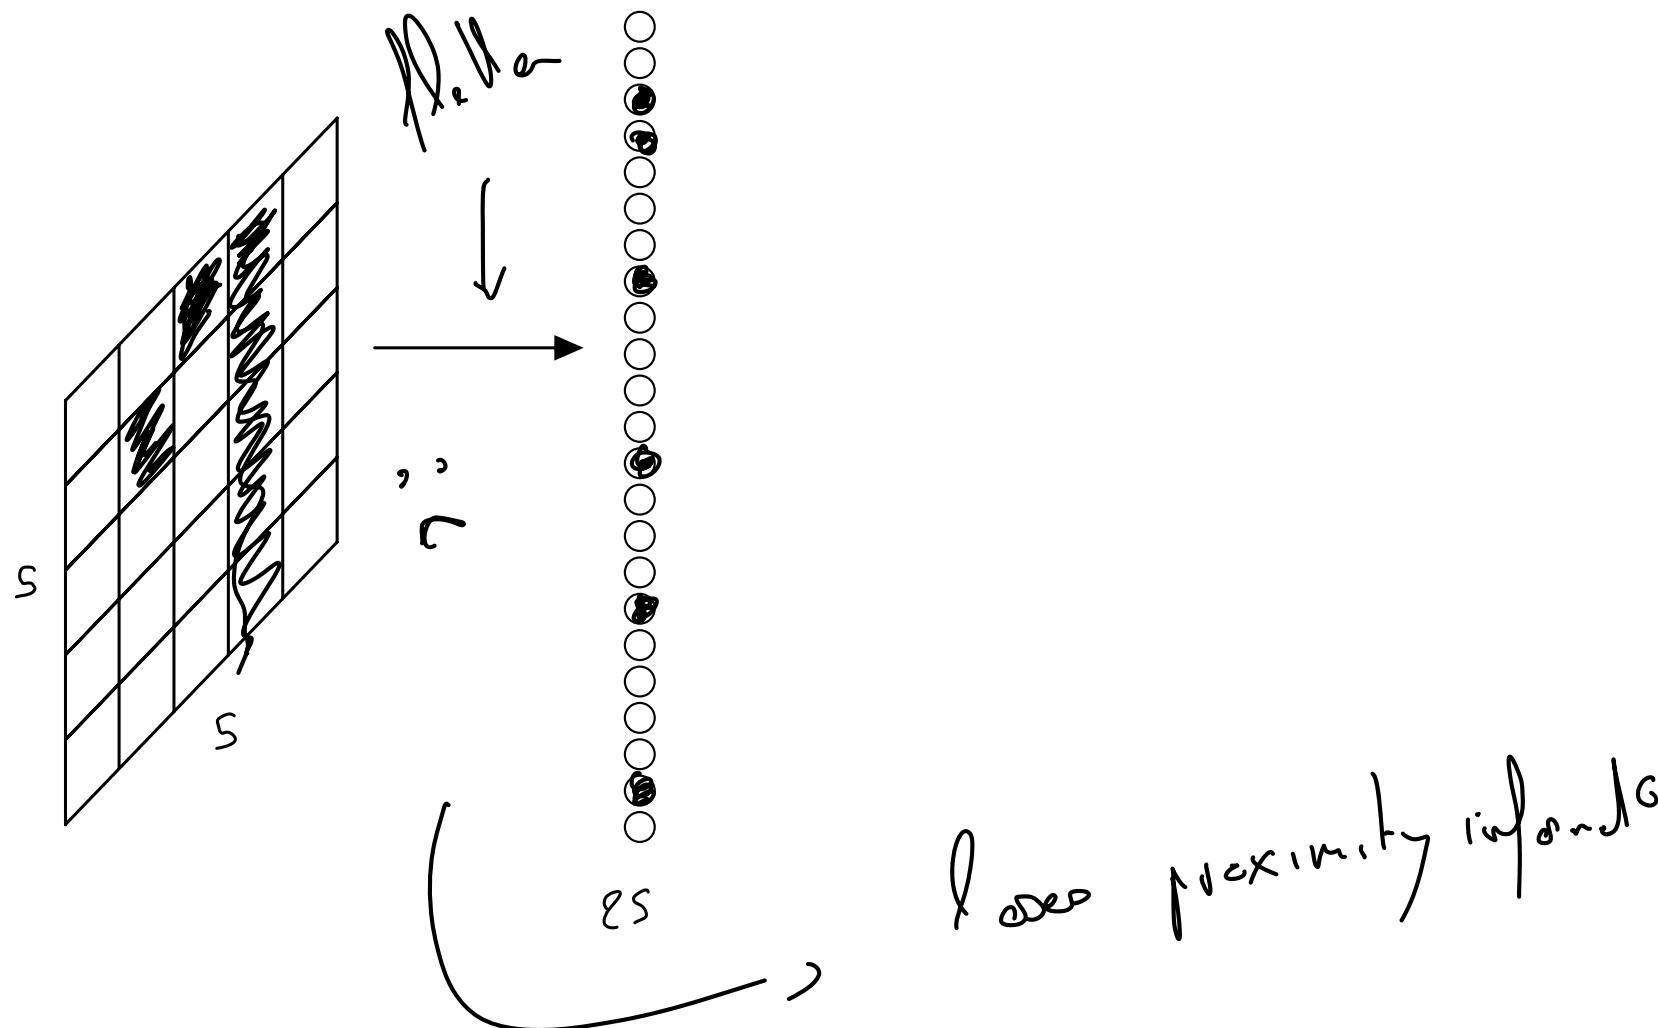

- Does not take into account local information. It would work similarly on any permutation of the pixels!
- Has, just on the first layer, as many parameters as there are inputs!

Convolutional Layer

Instead of making a linear combination of all the pixels, we consider a weighted average of a moving window of pixels, of size 3×3 , or 5×5 ...

Object tracking

Object Detection in a video:

- YOLO <https://pjreddie.com/darknet/yolo/>
- YOLO - James Bond <https://www.youtube.com/watch?v=V0C3huqHrss>

Deep Learning - Many many other applications!

- ① Image and video (super-resolution, 3D, Image captioning), medical applications...
- ② Self Driving cars (scene segmentation, etc.)
- ③ In NLP (language, text), automatic translation, voice recognition, text generation, next word completion ... (Virtual assistants)
- ④ Recommendation systems...
- ⑤ For time series, complex datasets too...

But also beyond the supervised settings: using adversarial networks (GANS) for generation of images, faces, voice, etc.

Feedback

Car accidents

Female drivers and right front passengers are approximately

**17 percent more likely
to be killed**

in a car crash than a male occupant of the same age.

Any seatbelt-wearing female vehicle occupant has

**73 percent greater odds of being
seriously injured**

in a frontal car crash than the odds of a seatbelt-wearing male occupant being injured in the same kind and severity of crash.

Sources: NHTSA and the journal Traffic Injury Prevention

Analysis of crash and injury data compiled from the National Automotive Sampling System Crashworthiness Data System for the years 1998 to 2015.

Bias in crash test

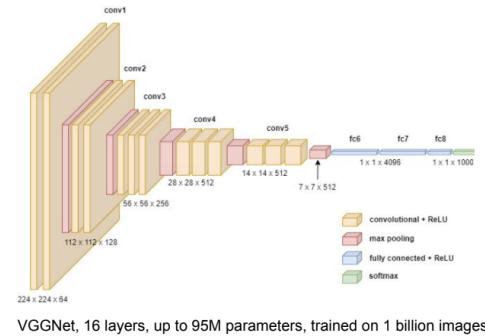

<https://www.consumerreports.org/car-safety/crash-test-bias-how-male-focused-testing-puts-female-drivers-at-risk/>

Interpretability

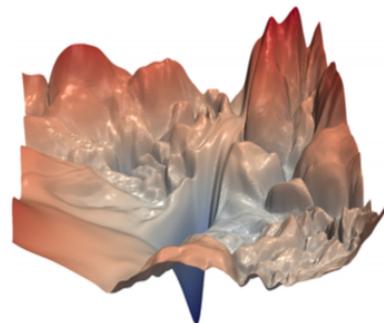

Very hard questions:

- ➊ How can I interpret the impact of each feature in my prediction?

- ➋ What is the impact of each training point in my model?

→ (data valuation, sourcing)

⚠ Hard to avoid! Model size makes interpretability and learning dynamics always more complex.

Ecological impact and energy consumption

⚠ Foundation Models and Intellectual Property are not easily compatible

Societal challenges

Society and jobs

- **Transformation of Current Jobs and Emergence of New Roles:** New positions focused on the development, management, and supervision of AI systems.
- **Societal Risks and Benefits of AI:** Risks such as job loss, algorithmic discrimination, and privacy protection.

Society and democracy, crime, etc.

- **Democratic and Political Challenges** Mass manipulation, echo chambers, hacking.
- Criminal usage (e.g., deepfakes)

Society and Sovereignty

- **Concentration of Major AI Players** → competition, innovation, and benefit distribution.
- The Sovereign AI Challenge: The concept of sovereign AI implies a country's capacity to develop, deploy, and control its own AI technologies, raising concerns about technological dependence.

Cost of storing data

- Money: 300.000 US dollars in Google Cloud to store 1 petabyte during one year.

Cost of storing data

- Money: 300.000 US dollars in Google Cloud to store 1 petabyte during one year.
- Data centers and environment
 - 2% of the total electricity consumption in the US.
 - 626 billion liters of water.
 - 2% of total global greenhouse emissions.

⚠ Hard to avoid - model performance is directly related to data.

- Mass surveillance.

Deep Learning: questionable applications

💡 A challenging problem: chain of responsibility. The same tools are used for positive and negative applications, e.g.:

- mass surveillance
- tumor recognition

are both based on image recognition...

Good news ! the research community is very aware of the situation.

Conclusion: Deep Learning in one slide

- **How does it work:**

- ▶ Automatically learn representations of observations
- ▶ Learn highly non-linear models.

- **What does it require:**

- ▶ Large datasets with structure
- ▶ Computational power

- **Why now:**

- ▶ Combination of the 2 points above
- ▶ investment!

- **Some Applications**

- ▶ Image classification; object / face recognition
- ▶ Self driving cars
- ▶ Automatic Translation, Information extraction
- ▶ Caption Generation
- ▶ Ads, recommendation systems, etc.

Goals: Understanding core concepts of Deep Learning.

- When and how it works on paper (data, models, architecture)
- How to implement a simple neural network with Python.
- Overview of some of the main applications and challenges.

What happens here?

The interface shows a neural network diagram with 5 layers: Input, 4 Hidden Layers, and Output. The input layer has 3 neurons, the hidden layers each have 4 neurons, and the output layer has 2 neurons. Activation functions are labeled as 'Signed' for the first three layers and 'Logistic' for the final layer. Below the diagram, a scatter plot shows data points with a blue decision boundary.

Poll Options:

- 1 Logistic Regression works (data is linearly separable) - 0% (0 votes)
- 2 I should use more neurons - 12% (3 votes)
- 3 The network overfits - 8% (2 votes)
- 4 I should add more layers - 15% (4 votes)
- 5 I should change the activation function - 85% (22 votes)
- 6 Logistic regression fails - 12% (3 votes)
- 7 One hidden layer is sufficient - 0% (0 votes)
- 8 I should change to a non linear activation - 0% (0 votes)

What happens here?

The slide features a neural network diagram with 4 hidden layers and 1 output layer. The output shows a hand icon with a color scale from 0 to 1. Below the diagram is a list of statements with their respective vote counts:

- 1 Logistic Regression works linearly separable 0% 0
- 2 I should use more neurons 4% 1
- 3 The network overfits 83% 19 ✓
- 4 I should add more layers 0% 0
- 5 I should change the activation function 4% 1
- 6 Logistic regression fails 0% 0
- 7 One hidden layer is sufficient 0% 0
- 8 I should change to a non-linear activation 9% 2

At the bottom, there are navigation links for Questions (9), Messages, Exit, and a progress bar showing 100%.
